

## ABSTRACT

An anti-piracy system introduces distortion into a recorded image, while maintaining a high quality projected image. The video source material includes 5 modulated entities for providing artifacts incompatible with the content of the video source material and selectively deliverable information that the projection system uses to demodulate the entities. A projector receives the information about the modulated entity and corrects, or demodulates, the entity. The projection system also imposes a recording device dependent interference on the projected images.
